1. Identify the Switch Problem

1 Switch is not powering ON

- Check the power cable and power socket.
- Check the power LED on the switch.
- Test the power socket with another device.
- If the power supply or the switch has failed, contact the hardware support team.

2 Port is not working

- Check whether the port LED is ON.
- Try a known-working Ethernet cable.
- Connect the computer to another known-working port.
- Check whether the port is administratively disabled.

3 No network or internet connection

- Check the uplink cable connecting the switch to the router or core switch.
- Check the computer's IP address.
- Check VLAN configuration.
- Test connectivity to the default gateway.

4 Network is slow or disconnecting

- Check for damaged cables or CRC errors.
- Check port speed and duplex settings.
- Check CPU and memory usage, if supported.
- Check for network loops, broadcast storms, or overloaded uplinks.
